

Volcano Eruption!

An Adventure with Jwalamukhi - Our Fire Mountain

PLANRS Academy Master Course

The Mystery Mountain Story

Meet the Mountain That Breathes Fire!

*Imagine a mountain that can breathe fire and smoke! This special mountain is called a **Jwalamukhi**—our Fire Mountain friend! [cite: 4]*

What is a Volcano?

A mountain with a special opening at the top! [cite: 4]

Deep inside the Earth, it is very, very hot. So hot that even rocks melt! [cite: 3]

Key Word: Magma

Hot melted rock hiding deep inside the Earth! [cite: 4]

The Parts of a Volcano

Every volcano has special parts that work together. Let's explore what's inside our Fire Mountain! [cite: 4]

- *Vent: The opening where hot lava escapes—like a chimney! [cite: 4]*
- *Crater: The bowl-shaped top of the volcano—like a giant cup! [cite: 4]*
- *Magma & Lava: Magma is melted rock inside; Lava is when it comes out! [cite: 4]*

The Chimney Rule

*Just like smoke leaves a kitchen through a chimney, the fire leaves a volcano through the
Vent!*

Magma vs. Lava

What's the Difference? Let's Find Out!

Think of it like juice! [cite: 4]

Magma: Like juice inside a bottle—it stays underground. [cite: 4]

Lava: Like juice poured out—it flows outside the volcano! [cite: 4]

When magma comes out of the vent and becomes lava, it is very bright orange and red. It flows slowly down the mountain like hot honey! [cite: 3]

The Three States of Volcanoes

The Sleeping Giant Story

Volcanoes can be in different states, just like how we can be awake, sleeping, or have moved away! [cite: 4]

<i>State</i>	<i>Meaning</i>
<i>Active</i>	<i>Awake and erupting (or will soon)! [cite: 4]</i>
<i>Dormant</i>	<i>A "Sleeping Giant" resting for now, but may wake up. [cite: 4]</i>
<i>Extinct</i>	<i>Gone forever—it will never wake up again. [cite: 4]</i>

Most volcanoes are sleeping giants, but scientists watch them very closely! [cite: 3]

India's Volcanoes

Did you know India has its own Fire Mountains? [cite: 4]

1. Barren Island

Located in the Andaman & Nicobar Islands, this is South Asia's only active volcano today! [cite: 3, 4]

2. The Deccan Traps

Millions of years ago, lava flowed in Maharashtra to make big hills. These show how volcanoes shaped India's land long ago! [cite: 3, 4]

Fun Fact: The soil in Maharashtra is often black because of ancient lava! [cite: 3]

Recap: What We Learned

You are now a Volcano Expert! [cite: 4]

- *A volcano is a mountain with magma inside. [cite: 4]*
- *Vent = Chimney, Crater = Cup. [cite: 4]*
- *Magma (Inside) vs. Lava (Outside). [cite: 4]*
- *Active (Awake), Dormant (Sleeping), Extinct (Gone). [cite: 4]*
- *Barren Island is India's active volcano! [cite: 4]*

Congratulations, Explorers! Keep exploring nature! [cite: 4]
